

YOUR SIX-WEEK BALANCE PLAN

Harrison Pascoe

Aesthetics. Functional strength. Grappling support.

The brief

A fixed six-week training and nutrition starting plan designed to build useful strength, muscle and repeatable habits. It gives you a clear structure to follow, evidence to collect and a practical foundation for grappling. It does not promise weekly plan changes inside this six-week block.

Prepared by Shannon Birch

Balance coaching

IMPORTANT STARTING POINT

Your nutrition targets use 110 kg only as a provisional planning estimate because no confirmed weigh-in was supplied. It is not being treated as your factual bodyweight. Use the plan for six weeks, then assess the real evidence: training quality, recovery, appetite, energy, progress photos and any bodyweight data you choose to record.

HOW TO USE THE PLAN

Simple rules for the six weeks

- Follow the weekly structure. Recovery days are part of the program, not missed training.
- Use technically clean reps. Stop a set when the target movement or position breaks down.
- For loaded work, begin with a weight you control and progress only when the planned reps stay clean.
- Share workouts and meals into the Balance feed. Each post creates evidence, makes progress visible and can reinforce the identity you are building.
- If a movement causes sharp, escalating or unusual pain, stop and get appropriate professional guidance.

Posture for performance

Posture is control of your ribcage, pelvis and shoulder blades around your centre of mass while you breathe, move and handle load. It is not a stiff, perfect pose. Training your upper back, trunk, hips and shoulders builds the capacity to keep producing force and adapting position during grappling.

WEEK AT A GLANCE

MON	Back & Biceps	Strength + grip
TUE	Chest & Triceps	Heavy press + chest
WED	Recovery	60-minute easy walk
THU	Legs	Strength + controlled unilateral work
FRI	Shoulders & Arms	Controlled accessory work
SAT	Core & Grappling Support	Trunk + grip + body control
SUN	Full rest	Recover

Back & Biceps

The rows, pulldown and pull-ups build more than back strength. Holding and moving load also trains grip and trunk bracing, while the farmer carries make that grappling link direct.

Warm-up

2 x 10 each Cable external rotations, cable internal rotations and face pulls. Keep all three light, smooth and controlled.

T-bar row

5 x 6 Brace first. Hinge through the hips rather than extending and flexing the lower back. Drive the elbows and keep the load close.

Seated cable row

4 x 10 Keep the torso mostly still. Reach forward under control, guide the shoulder blades back and down, then row toward the lower ribs.

Lat pulldown

5 x 6 Set the thigh pad firmly so the body is anchored and force can transfer through the trunk and lats. Keep the ribs stacked and drive the elbows down toward the sides.

Assisted pull-ups

3 sets to technical failure End the set when position or control breaks down. Reduce assistance over time, then progress toward bodyweight and eventually weighted pull-ups.

Biceps curls

3 x 12 Stack the ribs over the pelvis, use a light glute brace, keep the shoulders quiet and avoid swinging.

Farmer carries

3 carries x 30 total steps Hold the load securely, stand tall without becoming rigid and keep the upper back and trunk braced. This directly supports grip and load control for grappling.

TUESDAY

Chest & Triceps

Warm-up

2 x 10 each Cable external rotations, cable internal rotations and face pulls. Keep the movement light and controlled.

Decline press

5 x 6 Use this as the heavy press because it gives you a strong, comfortable shoulder position. Keep the shoulder blades supported and control the range.

Standing low-to-high cable fly

3 x 10 Use a controlled arc for direct upper-chest work. Keep the ribs stacked and avoid turning the movement into a press or a whole-body swing.

Triceps extensions

4 x 10 Keep the upper arm position quiet and finish each rep with control rather than momentum.

Why this pressing mix

Incline pressing is not inherently harmful. Individual comfort, training load, range, technique and history all matter. Decline pressing plus low-to-high cable flies is simply the chosen mix for this six-week block. It is not a universal safety rule or medical claim.

WEDNESDAY

Recovery

Easy walk

60 minutes Keep the pace conversational. The aim is circulation, movement and recovery, not turning the day into another hard session.

Legs

Optional preparation

Light kettlebell swings Use these only if you already own the technique. They are preparation for the session, not fatigue work. Skip them if the skill is not already established.

Barbell back squat

Work through easy warm-ups, then 3 x 6 Choose a technically clean load. 100 kg is an example, not a target; use 80 kg or less if needed. Brace before each rep, keep the bar balanced over the mid-foot and use the controlled depth you can own.

B-stance RDL

3 x 10 each leg Choose the load by control. Keep most of the work in the front leg, maintain a long spine and hinge through the hips.

Bodyweight Bulgarian split squat

3 x 6 each leg Take 3-5 seconds down and 3-5 seconds up. Keep the range and balance you can control throughout.

Calf raises

3 x 20 Use a controlled stretch and a full, deliberate rise. Avoid bouncing through the bottom.

Progression rule

A clean rep earns progression. Add load only after the planned sets and reps stay controlled. The example squat loads do not override your actual readiness on the day.

FRIDAY

Shoulders & Arms

Lateral raises

5 x 15 Use a relatively light load and move slowly under control so the side delts do the work. Loading too heavily often brings in the traps, momentum and other muscles.

Cable rear-delt fly

3 x 15 Keep it relatively light, slow and controlled so the rear delts do the work. Avoid loading so heavily that traps, momentum and other muscles take over.

Triceps pushdowns

4 x 12 Keep the shoulders quiet and control the full working range.

Preacher curls

4 x 12 Keep the upper arm supported and control the lowering phase.

SATURDAY

Core & Grappling Support

Hanging leg raises

4 x 12 These train the hip flexors and abs. Finish each rep by curling the pelvis upward into a posterior pelvic tilt to increase abdominal contribution. They also build grip and body control for pull-ups.

Cable crunches

4 x 12 Use the knees as an anchor, hold the hips roughly at a right angle and curl the torso toward the pelvis without turning it into a hip hinge.

Cable woodchops

3 x 10 each side Rotate under control while the trunk, hips and feet share the movement. Do not rush the return.

No sit-outs are included in this program.

SUNDAY

Full rest

No planned training. Eat, hydrate, sleep and let the week consolidate.

Four-meal daily starting template

Provisional six-week target

Start around 2,900 calories and 180-200 g protein per day. This is a general starting plan built from a provisional 110 kg planning estimate, not a confirmed bodyweight or fully personalised calculation. Portions are adjustable starting points, and food labels and cooking methods will change the totals.

- No seafood of any kind. No prawns, crustaceans or shellfish.
- Use mostly lean protein sources and repeat simple meals rather than chasing novelty.
- Distribute protein across all four meals and include vegetables with the main meals.
- If appetite, energy, recovery or training quality is clearly poor, record the pattern rather than guessing from one day.

MEAL 1

Oats + blueberries + milk + protein

A repeatable breakfast with carbohydrate for training and a meaningful protein serve.

Build it: Oats, blueberries and milk plus whey/protein powder or Greek yoghurt.

Starting portion guide: About 750-800 calories and 45-50 g protein.

MEAL 2

Chicken + rice + vegetables

A simple high-protein main meal with useful carbohydrate and fibre.

Build it: Lean chicken, cooked rice, a large vegetable serve and a measured amount of cooking oil or sauce.

Starting portion guide: About 750-800 calories and 45-50 g protein.

The remaining two meals

MEAL 3

Banana protein smoothie

A practical meal when time or appetite is limited.

Build it: Milk, banana and protein powder. Add oats or peanut butter when more energy is needed; use one or both according to the day.

Starting portion guide: About 550-650 calories and 35-45 g protein.

MEAL 4

Lean steak + rice + vegetables

A satisfying final meal with protein, carbohydrate and micronutrient variety.

Build it: Lean steak, cooked rice, vegetables and a measured amount of cooking oil or sauce.

Starting portion guide: About 750-850 calories and 45-55 g protein.

DAILY RANGE

Together, these starting portions land at roughly 2,800-3,100 calories and about 180-200 g protein depending on brands, exact cuts, milk choice and optional smoothie additions. Aim near the middle rather than trying to make every day mathematically perfect.

Alcohol

Regular or heavy alcohol can add a meaningful amount of energy, interfere with fat oxidation, disrupt sleep and make food choices harder. It can also blunt the post-training muscle-protein-synthesis response. This is not a moral judgement: it is simply a trade-off to include when you assess recovery and progress.

Your free six-week course access

Shannon is including Balance Foundations free for this six-week program. The current course contains six weekly sections with five interactive lesson-to-quiz experiences in each week: 30 quizzes in total.

WEEK 1	Understand why change feels hard Predictions, past evidence and updating the model rather than blaming yourself.
WEEK 2	Work with your energy, not against it The body budget, stress, tiredness and why low energy changes choices.
WEEK 3	Build a rhythm that can stick Repetition, smaller actions, environment and how habits reduce decision demand.
WEEK 4	Take the fight out of food Cravings, emotional eating and meeting the need underneath the choice.
WEEK 5	Make the better choice easier Willpower, predictions, routines, surroundings and social support.
WEEK 6	Build a way of eating you can keep Energy balance, protein, carbohydrate, fat and a flexible eating pattern.

The course turns predictive-processing and free-energy-principle ideas into practical healthy-lifestyle skills: collecting better evidence, managing energy, reducing decision friction, shaping the environment and building a flexible way of eating.

Expectation for Phase Two

Complete the Foundations course during this six-week block. Shannon expects course completion before continuing coaching into the next phase because Phase Two includes a separate course. This keeps the next block practical and builds on a shared foundation rather than skipping ahead.

CONSISTENCY

Make the work easier to return to

The gym does not become effortless. Habits reduce decision friction: the bag is packed, the training time is protected and the first step is familiar. Identity and environment then support the pattern. Your coach, supportive people, the content you consume and the commitments you make all influence what feels normal.

Messy weeks still count

Consistency is not a perfect streak. It is the ability to return quickly after a disrupted week. Share the session you did, the meal you made and the next useful choice. That visible evidence helps update the story from 'I never stick to it' to 'I am someone who returns.'

Use the Balance feed as evidence

- Share completed workouts so effort and progression become visible.
- Share meals so the food pattern is concrete rather than remembered vaguely.
- Use the record to notice what happens around training quality, hunger, energy and recovery.
- Let imperfect posts count. The purpose is evidence, not performance.

AFTER THE SIX WEEKS

Accountability can continue

This plan is a fixed six-week program. It does not include a promise of ongoing personalised weekly adjustments. More feedback can make patterns in training, food, bodyweight and energy visible, though, so if you want the program to evolve after the block, ask Shannon about weekly coaching or check-ins for the next phase.

What to review at the end

- Which lifts improved while technique stayed clean?
- Which meals were easiest to repeat?
- What did sleep, alcohol, workload and grappling do to recovery?
- What evidence says the next block should add load, volume, conditioning or accountability?

Your only job now

Follow the structure, record the evidence and return quickly when a week gets messy. Six weeks is long enough to build useful data and short enough to stay focused.
